Coronavirus (COVID-19) - Exposure

After Hours Telephone Triage Protocols - Standard | Adult | 2020

DEFINITION

- Exposed (close contact) to a person who has been diagnosed (confirmed by testing) or suspected to have COVID-19.
- Patient has no common COVID-19 symptoms (i.e., cough, fever, shortness of breath, muscle aches)
- Questions about COVID-19

Close Contact COVID-19 Exposure is defined as:

- Living in the same house with a confirmed or suspected COVID-19 case
- Being within 6 feet (2 meters) of a confirmed or suspected COVID-19 case for a total of 15 minutes or more during a 24 hour period. Examples of such close contact include kissing or hugging, sharing eating or drinking utensils, carpooling, close conversation, or performing a physical examination (relevant to healthcare providers).
- OR having direct contact with infectious secretions of a confirmed COVID-19 case (e.g., being coughed on).

The following are not Close Contact exposures:

- Walking by a person who has COVID-19.
- Being outdoors and keeping safe distancing (6 feet; 2 meters).

Congregate Setting is defined as:

- A congregate setting is a place where a group of people live or work in close proximity to each other.
- Examples are correctional facilities, long term care facilities, homeless shelters, and meat-packing plants.

Note to Triager:

- During a time of community spread of COVID-19, patients with cough, fever, shortness of breath, or other compatible COVID symptoms should be suspected as having COVID-19.
- Triagers should use their clinical judgment, but generally will want to use the COVID-19 Diagnosed or Suspected guidelines when a patient calls with cough, shortness of breath, or a combination of typical COVID symptoms and there is community spread.

This guideline was last updated 1/3/2021.

INITIAL ASSESSMENT QUESTIONS

1. COVID-19 CLOSE CONTACT: "Who is the person with the confirmed or suspected COVID-19 infection that you were exposed to?"
2. PLACE of CONTACT: "Where were you when you were exposed to COVID-19?" (e.g., home, school, medical waiting room; which city?)
3. TYPE of CONTACT: "How much contact was there?" (e.g., sitting next to, live in same house, work in same office, same building)
4. DURATION of CONTACT: "How long were you in contact with the COVID-19 patient?" (e.g., a few
seconds, passed by person, a few minutes, 15 minutes or longer, live with the patient)
5. MASK: "Were you wearing a mask?" "Was the other person wearing a mask?" Note: wearing a mask reduces the risk of an otherwise close contact.
6. DATE of CONTACT: "When did you have contact with a COVID-19 patient?" (e.g., how many days ago)
7. COMMUNITY SPREAD: "Are there lots of cases of COVID-19 (community spread) where you live?" (See public health department website, if unsure)
8. SYMPTOMS: "Do you have any symptoms?" (e.g., fever, cough, breathing difficulty, loss of taste or smell)
9. PREGNANCY OR POSTPARTUM: "Is there any chance you are pregnant?" "When was your last menstrual period?" "Did you deliver in the last 2 weeks?"
10. HIGH RISK: "Do you have any heart or lung problems? Do you have a weak immune system?" (e.g., heart failure, COPD, asthma, HIV positive, chemotherapy, renal failure, diabetes mellitus, sickle cell anemia, obesity)
11. TRAVEL: "Have you traveled out of the country recently?" If so, "When and where?" Also ask about out-of-state travel, since the CDC has identified some high-risk cities for community spread in the US. Note: Travel becomes less relevant if there is widespread community transmission where the patient lives.

TRIAGE ASSESSMENT QUESTIONS

See More Appropriate Guideline

COVID-19 lab test positive

Go to Guideline: Coronavirus (COVID-19) - Diagnosed or Suspected (Adult)

[1] Lives with someone known to have influenza (flu test positive) AND [2] flu-like symptoms (e.g., cough, runny nose, sore throat, SOB; with or without fever)

Go to Guideline: Influenza - Seasonal (Adult). Note: patient is more likely to have flu than COVID-19 if they are living with someone who tested positive for influenza.

[1] Symptoms of COVID-19 (e.g., cough, fever, SOB, or others) AND [2] HCP diagnosed COVID-19 based on symptoms

Go to Guideline: Coronavirus (COVID-19) - Diagnosed or Suspected (Adult)

[1] Symptoms of COVID-19 (e.g., cough, fever, SOB, or others) AND [2] lives in an area with community spread

Go to Guideline: Coronavirus (COVID-19) - Diagnosed or Suspected (Adult). Note: Triager should use clinical judgment to decide whether a symptom guideline (e.g., Chest Pain, Fever, Headache) should also be used in adult patients.

[1] Symptoms of COVID-19 (e.g., cough, fever, SOB, or others) AND [2] within 14 days of EXPOSURE (close contact) with diagnosed or suspected COVID-19 patient

Go to Guideline: Coronavirus (COVID-19) - Diagnosed or Suspected (Adult). Note: Triager should use clinical judgment to decide whether a symptom guideline (e.g., Chest Pain, Fever, Headache) should also be used in adult patients.
[1] Symptoms of COVID-19 (e.g., cough, fever, SOB, or others) AND [2] within 14 days of travel from high-risk area for COVID-19 community spread (identified by CDC)

  Go to Guideline: Coronavirus (COVID-19) - Diagnosed or Suspected (Adult). Note: Triager should use clinical judgment to decide whether a symptom guideline (e.g., Chest Pain, Fever, Headache) should also be used in adult patients.

  Go to Guideline: Breathing Difficulty (Adult)

  Go to Guideline: Cough - Acute Non-Productive (Adult)

[1] Wet cough (i.e., white-yellow, yellow, green, or rusty colored sputum) AND [2] onset > 14 days after COVID-19 EXPOSURE

  Go to Guideline: Cough - Acute Productive (Adult)

  Go to Guideline: Common Cold (Adult)

COVID-19 vaccine reaction suspected (e.g., fever, headache, muscle aches) occurring during days 1-3 after getting vaccine

  Go to Guideline: Coronavirus (COVID-19) - Vaccine Questions and Reactions (Adult)

COVID-19 vaccine, questions about

  Go to Guideline: Coronavirus (COVID-19) - Vaccine Questions and Reactions (Adult)

Call PCP within 24 Hours

  Reason: COVID-19 viral test is recommended; return to work clearance, employee may need to discuss with their employee health department.

  CA: 50, 22, 32, 610, 27, 31, 15, 19, 3, 8, 12, 9, 29, 20, 26, 1

[1] CLOSE CONTACT COVID-19 EXPOSURE within last 14 days AND [2] exposed person is a first responder (e.g., police or paramedic) AND [3] NO symptoms

  Reason: COVID-19 viral test is recommended; exposed first responder; employee health should be notified.

  CA: 50, 22, 27, 31, 15, 19, 3, 8, 12, 9, 29, 20, 26, 1

[1] CLOSE CONTACT COVID-19 EXPOSURE within last 14 days AND [2] exposed person is a healthcare worker who was NOT using all recommended personal protective equipment (i.e., a respirator-N95 mask, eye protection, gloves, and gown) AND [3] NO symptoms

  Reason: COVID-19 viral test is recommended; exposed healthcare worker; employee health should be notified.

  CA: 50, 22, 27, 31, 15, 19, 3, 8, 12, 9, 29, 20, 26, 1
[1] Living or working in a correctional facility, long-term care facility, or shelter (i.e., congregate setting; densely populated) AND [2] where an outbreak has occurred AND [3] NO symptoms

Reason: COVID-19 viral test is recommended in when outbreaks occur in congregate setting. Note: Local public health should be notified.
CA: 50, 22, 32, 610, 27, 31, 15, 19, 3, 8, 12, 9, 29, 20, 26, 1

Call PCP when Office is Open

Reason: COVID-19 viral test is recommended; Note: Home quarantine needed. Follow local or state Public Health Department (PHD) guidance about staying at home, monitoring symptoms, etc.
CA: 51, 22, 32, 610, 31, 15, 19, 3, 8, 12, 9, 29, 20, 26, 1

Home Care

Reason: Asymptomatic for 14 days. Risk of developing COVID-19 infection has passed. Reassure and discontinue quarantine.
CA: 48, 18, 3, 4, 5, 1047, 90, 1

[1] Living in area with community spread (identified by local PHD) BUT [2] NO symptoms

Follow local or state Public Health Department (PHD) guidance about staying at home, monitoring symptoms, etc.
CA: 48, 14, 3, 4, 5, 11, 29, 1047, 20, 26, 1

Follow local or state Public Health Department (PHD) guidance about staying at home, monitoring symptoms, etc.
CA: 48, 16, 3, 4, 7, 11, 29, 1047, 20, 26, 1

[1] No COVID-19 EXPOSURE BUT [2] living with someone who was exposed and who has no symptoms of COVID-19

Reason: no exposure, no symptoms.
CA: 48, 2, 3, 4, 5, 1047, 7, 1048, 34, 35, 90, 1

Reason: no exposure and needs reassurance
CA: 48, 21, 11, 3, 4, 5, 1047, 7, 13, 1048, 90, 1

COVID-19 Testing, questions about

CA: 48, 30, 8, 12, 9, 23, 24, 25, 1048, 90, 1

COVID-19 Prevention and Healthy Living, questions about

Note: How to protect you and your family; how to reduce anxiety and stress.
CA: 48, 1047, 1048, 1049, 1050, 1051, 611, 90, 1

COVID-19 Disease, questions about

Reason: No known exposure and no symptoms. Note: Refer most callers to CDC website: https://www.cdc.gov/coronavirus.
CA: 48, 2, 3, 4, 5, 1047, 7, 11, 1048, 10, 13, 34, 35, 90, 1
1. **Care Advice** given per Coronavirus (COVID-19) - Exposure (Adult) guideline.

2. **COVID-19 (Coronavirus Disease 2019) - Outbreak:**
   - An outbreak of this infection began in China in December 2019.
   - Four patients were confirmed in Canada on January 31, 2020.
   - The Centers for Disease Control and Prevention (CDC) is considered the source of truth for this guideline. This continues to be a rapidly changing situation and guidance from the CDC is being updated daily. See https://www.cdc.gov/coronavirus/2019-ncov/index.html.

3. **COVID-19 - Symptoms:**
   - COVID-19 most often causes a respiratory illness.
   - The *most common symptoms are*: cough, fever, and shortness of breath.
   - Other *less common symptoms are*: chills, fatigue, headache, loss of smell or taste, muscle pain, and sore throat.
   - Some people may have minimal symptoms or even have no symptoms (asymptomatic).

4. **COVID-19 - Exposure Risk Factors:**
   - Here are the *main risk factors for getting sick with COVID-19*.
   - **Close contact with a person** who tested positive for COVID-19 AND contact occurred while they were ill. Close contact means being within 6 feet (2 meters) for a total of 15 minutes or more in a 24-hour period. This includes living with someone infected with COVID-19.
   - **Living in or travel from a city** or area where there is community spread of COVID-19. This carries a lower risk compared to close contact if one follows physical distancing recommendations. Community spread has occurred in most of the US, especially in cities.
   - **International Travel:** The CDC (https://www.cdc.gov/coronavirus/2019-ncov/travelers) has the most up-to-date list of where COVID-19 outbreaks are occurring.

5. **COVID-19 - How it Is Spread:**
   - **COVID-19 is spread from person to person.**
   - **Respiratory Droplets:** The virus spreads from respiratory droplets that are produced when a person coughs, sneezes, shouts, or sings. The infected droplets can then be inhaled by a nearby person or land on the surface of their face or eyes. Droplets fall quickly to the floor or ground. This is *how most COVID is spread*.
   - **Surfaces:** Most infected people also have respiratory secretions on their hands. These secretions get transferred to healthy people on doorknobs, faucet handles, etc. The virus then gets transferred to healthy people when they touch their face or rub their eyes. This is a *less common cause* of spread.
   - **Aerosols:** Aerosols are tiny, invisible particles that can float in the air for 1 to 2 hours and travel more than 6 feet (2 meters). They only occur in a closed room with poor ventilation. Aerosols are a *rare cause* of COVID-19 spread.
7. **COVID-19 - Travel Guidelines:**
   - The Centers for Disease Control and Prevention (CDC) maintains a website with latest recommendations regarding travel and your health.
   - Currently the CDC recommends against travel to many geographic areas with widespread and ongoing spread of COVID-19. See current list at https://wwwnc.cdc.gov/travel/.
   - **CDC Travel Health Website**: https://wwwnc.cdc.gov/travel/.

   - People who have symptoms of COVID-19.
   - People who have had close contact, within 6 feet (2 meters) for a total of 15 minutes or more in a 24-hour period, with someone with confirmed to have COVID-19. People who live with someone confirmed to have COVID-19.
   - People living or working in a congregate setting (such as a correctional facility, long-term care facility, or shelter) where an outbreak has occurred.

   - There are two types of tests available for COVID-19: viral tests and antibody tests.
     - **Test for Current Infection - Viral Test**: A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva sample. Symptomatic patients should get a test within 3 days, if available. Asymptomatic people with a close contact COVID-19 exposure should get the viral test on day 5 to 7 after exposure.
     - **Test for Past Infection - Antibody Test**: An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample. An antibody test may not be able to show if you have a current infection, because it can take 1 to 3 weeks for your body to make antibodies to the infection. We do not know yet if having antibodies to the virus can protect someone from getting infected with the virus again, or how long that protection might last. If an antibody test is needed, it is usually performed 2 to 3 weeks after the start of the infection.
     - The results usually come back in 1 to 3 days, but may take longer depending on testing kit or testing site availability.

10. **COVID-19 - Going to the ER or Urgent Care Center:**
    - If you or your child needs to be seen for an urgent medical problem, do not hesitate to go.
    - ERs and urgent care centers are safe places. They are well equipped to protect you against the virus.
    - For non-urgent conditions, talk to your healthcare provider's office first.

11. **COVID-19 - Information About Testing:**
    - There are two types of tests available for COVID-19: viral tests and antibody tests. A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva (spit) sample. An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample.
    - The results usually come back in 1 to 4 days, but may take longer depending on testing kit or testing site availability.
12. **COVID-19 - Where to Go for Testing?**
- Go to the testing site recommended by your healthcare provider (e.g., doctor, NP, or PA) or public health department.
- Swabs of the nose or throat will only be collected on patients who have a healthcare provider’s order.
- Testing sites vary based on the city, hospital, and healthcare system.
- COVID-19 testing is now more available from local and state public health departments. Hospital and commercial labs now can perform COVID-19 testing. Many clinics and urgent care centers now perform testing.
- In general, they are not performed in private doctor’s offices.
- **People cannot just walk in and request a COVID-19 test.**

13. **Other COVID-19 Facts:**
- **Incubation Period:** Average 5 days (range 2 to 14 days) after coming in contact with a person who has COVID-19 virus.
- **No Symptoms, but Infected (Asymptomatic):** Approximately 30% of infected patients may have no symptoms.
- **Mild Infections:** About 80% of those with symptoms have a mild illness, much like a normal flu or a bad cold. The symptoms usually last 2 weeks.
- **Severe Infections:** About 20% of those with symptoms develop trouble breathing from viral pneumonia. Many of these need to be admitted to the hospital. People with complications generally recover in 3 to 6 weeks.
- **Death Rate:** The adult death rate is approximately 1% to 3%. The death rate is lower in children and younger adults. It is higher in older adults.
- **Treatment:** Treatment is supportive. Oxygen and IV fluids are used for hospitalized patients. On May 1, 2020 the U.S. Food and Drug Administration (FDA) granted temporary emergency use authorization (EUA) for the investigational antiviral remdesivir to treat COVID-19. Doctors can use this drug to treat patients who are hospitalized with COVID-19 who are severely ill. More research is needed to determine how well this drug works and for which patients.
- **Prevention - Vaccine:** Two vaccines have been approved and released for use in the United States and Canada as of December 2020. Other vaccines are in development.
- **Prevention - Medicine:** Currently, there is no medicine to prevent COVID-19. Warning: the malaria drug (chloroquine) was studied and found not to be helpful for this disease. It also had cardiac side effects. **Social distancing and wearing masks have been proven to help prevent COVID-19!**

14. **Reassurance and Education - Living in an Area With Community Spread:**
- Although you live in an area with community spread of COVID-19, you do not currently have the most common symptoms of COVID-19 infection: cough, fever, and shortness of breath.
- COVID-19 starts within 14 days of exposure.
- Monitor your symptoms.
- Call your healthcare provider if you develop a cough, fever, or shortness of breath.
15. **Reassurance and Education - COVID-19 Exposure With No Symptoms:**
   - **Get tested:** A person who had a close contact COVID-19 exposure and is asymptomatic should get a **COVID-19 viral test** about 5 to 7 days after exposure. Testing requires a healthcare provider's (HCP; doctor, NP, PA) order, like all medical tests. If you do get tested, you should stay home until you get your test results and follow the advice of your health care provider or a public health professional. If you test negative for COVID-19, it probably means you did not have COVID-19 at the time of testing, or that your sample was collected too early in your infection.
   - **Stay at Home:** Stay at home (quarantine). Do not go to work until 14 days after the exposure.
   - **Monitor Your Symptoms:** Check your temperature two times a day until 14 days after the exposure. Watch for symptoms of COVID-19.
   - **Here is some more care advice and information that should help.**

16. **Reassurance and Education - Travel Back From an Area of Community Spread:**
   - You do not currently have the most common symptoms of COVID-19 infection: cough, fever, and shortness of breath. COVID-19 starts within 14 days of exposure.
   - Since it's been less than 14 days since your travel back from an area or country of community spread of COVID-19, you still are at risk for getting sick with COVID-19.
   - Stay at home. Do not go to work until 14 days after the exposure.
   - **Monitor your symptoms until 14 days have passed.** Check your temperature two times a day.
   - Call your healthcare provider if you develop a cough, fever, or shortness of breath.

18. **Reassurance and Education - No Symptoms and Day 15 or Later:**
   - **COVID-19 starts within 14 days of exposure.**
   - The most common symptoms are cough, fever, and shortness of breath.
   - If you have not had any symptoms by day 15, you should be safe from getting the coronavirus.

19. **Watch for Symptoms of Cough and Fever:**
   - Watch for symptoms of cough and fever.
   - Measure your temperature 2 times each day, until 14 days after exposure.
   - Report any fever or other concerning symptoms to your healthcare provider.

20. **Home Isolation Needed if Symptoms Occur:**
   - **Isolation will be needed if you develop symptoms within 14 days of COVID-19 exposure:**
     - Isolate yourself at home.
     - Do Not allow any visitors.
     - Do Not go to work or school.
     - Do Not go to religious services, child care centers, shopping, or other public places.
     - Living with a suspected COVID-19 patient implies that close contact has occurred. In this case, both patient and family members should stay at home in isolation and quarantine.
21. **Note to Triager - Caller Remains Worried After Education and Reassurance:**
   - Encourage the caller to phone their healthcare provider (e.g., doctor, NP, PA) or public health department.
   - Discourage the caller from going to a healthcare facility unless warranted based on caller's symptoms.

22. **Alternate Disposition - Call Telemedicine Provider:**
   - Telemedicine may be your best choice for care during this COVID-19 outbreak.
   - You can talk to a telemedicine provider, if your own healthcare provider is not available.

23. **Understanding Viral Test Results:**
   - Viral tests look for part of the virus (RNA or proteins) in the test sample. Since this test looks for actual parts of the virus, it can tell you if you are currently infected (active infection) and at risk of spreading the disease. A viral test is done using a nasal (nose) swab or saliva (spit).
   - A **positive viral test** means that you most likely have an active COVID-19 infection and can spread the infection to others.
   - A **negative viral test** means that you likely did not have an active COVID-19 infection at the time the test was done.
   - **Note:** All tests can sometimes have a false (wrong) result. Some reasons for this include how the sample was collected, how long into the illness it was taken, and the type of test done. That is why it is important to discuss your results with your health care provider.

24. **Understanding Antibody Test Results:**
   - Antibody tests (also called serology tests) are done on blood samples.
   - COVID-19 antibody tests look for antibodies to the virus that causes COVID-19. Antibodies begin to form during an infection but can last as long as a lifetime. Therefore, an antibody test can NOT tell the difference between an active infection and one you had sometime in the past.
   - It is not yet known if antibodies protect you from getting COVID-19 again.
   - A **positive antibody test** means that you most likely have been, or are now, infected with COVID-19.
   - A **negative antibody test** means that you likely never had COVID 19 OR you have not yet formed antibodies to COVID-19.

25. **Understanding Viral and Antibody Testing Together:**
   - In some cases, your healthcare provider (HCP) may want to perform both antibody testing and viral testing together. The best source of information on understanding the test results will come from your HCP. Here is some information on how the two results can be used together.
   - **Both Tests Are Positive:** You most likely have an active infection and can spread COVID-19 to others.
   - **Both Tests Are Negative:** You likely do NOT have COVID-19 and likely never had a COVID-19 infection.
   - **Viral Test Is Positive and Antibody Test Is Negative:** You most likely have an active infection and can spread COVID-19 to others. You have not yet developed antibodies to your active COVID-19 infection.
   - **Viral Test Is Negative and Antibody Test Is Positive:** You likely do NOT have an active COVID-19 infection but did have COVID-19 sometime in the past.
26. **Call Back (or Call Your Healthcare Provider) If:**
   - Fever or feeling feverish occurs within 14 days of COVID-19 exposure.
   - Cough or difficulty breathing occur within 14 days of COVID-19 exposure.
   - Other symptoms of COVID-19 infection occur.
   - You have more questions.

27. **Alternate Disposition - Call Employee Health at Your Workplace Within 24 Hours:**
   - You need to call and discuss this with the Employee Health Department for your workplace within the next 24 hours.

29. **COVID-19 - Should You Go to Work After Exposure?**
   - If a person has had **close contact** exposure to COVID-19 in the last 14 days, it is recommended that they make plans to work from home until 14 days have passed.
   - Similarly, if a person has had travel from or is living in a **high risk area** (identified by CDC) it is also recommended that they make plans to work from home.
   - You should talk to the employee health office at your workplace.

30. **Note to Triager - COVID-19 Testing:**
   - **For questions about testing, it is best to direct the patient to their HCP** (doctor, NP, PA) during office hours. The HCP is the best resource for up-to-date information on testing. This is a somewhat complicated decision process. National and state testing recommendations continue to change. **Testing requires a HCP's order (as with all medical tests).**
   - COVID-19 testing is becoming more available from local and state public health departments. Commercial labs now can perform COVID-19 testing. However, it may still be difficult to find a place to get tested.
   - **What about a standing order?** As testing becomes more widely available, call centers should talk with their medical leadership about triagers being able to use a standing order for testing.

31. **Note to Triager - COVID-19 Testing After Close Contact Exposure:**
   - A person who had a close contact COVID19 exposure and is asymptomatic should get a COVID19 viral test.
   - **When:** 5 to 7 days after exposure. Testing right away after exposure isn't helpful because it may be too early in the incubation period and there isn't enough viral material for the test to detect.
   - **Where:** Options for testing vary by community. Triagers should refer to guidelines from your healthcare system, office practices, or department of health. COVID-19 testing is now more available from local and state public health departments. Hospital and commercial labs now can perform COVID-19 testing. Many clinics and urgent care centers now perform testing.
   - **Lab Test Order:** Testing requires a healthcare provider's (HCP; doctor, NP, PA) order, like all medical tests. The patient's HCP can order the test. A telemedicine provider can order a test.
   - **What About a Standing Order?** Some call centers have worked with their medical leadership to allow triage nurses to order COVID-19 testing under a standing order policy.
32. **Alternate Disposition - Department of Health:**
- Your local, state, or provincial Department of Health can help you find out how to get tested.
- Visit their website to see your best options for testing.

34. **FAQ - Can someone spread the virus who is not sick?**
- The virus spreads through respiratory droplets produced when an infected person coughs or sneezes. The droplets can then be inhaled by a nearby person.
- Therefore, an infected person is thought to be most contagious when they are sick and have symptoms of cough and fever.
- It is possible that an infected person could spread coronavirus before they start feeling sick. However, this is not the main way coronavirus spreads.

35. **FAQ - Can I get coronavirus from touching an infected surface?**
- It is possible that a person could get coronavirus by touching an object like a doorknob or a phone, or surfaces like a table or desk.
- However, this is not the main way coronavirus spreads.
- You can use a household cleaning spray or wipe (e.g., Clorox or similar) to clean the object or surface. *Follow the label instructions.*
- Remember, wash your hands often with soap and water.

40. **Call EMS 911 Now:**
- Immediate medical attention is needed. You need to hang up and call 911 (or an ambulance).
- *Triager Discretion:* I'll call you back in a few minutes to be sure you were able to reach them.

41. **Go to ED Now:**
- You need to be seen in the Emergency Department.
- Go to the ED at ___________ Hospital.
- Leave now. Drive carefully.

42. **Go To ED Now (or PCP triage):**
- **If No PCP (Primary Care Provider) Second-Level Triage:** You need to be seen within the next hour. Go to the ED/UCC at _____________ Hospital. Leave as soon as you can.
- **If PCP Second-Level Triage Required:** You may need to be seen. Your doctor (or NP/PA) will want to talk with you to decide what’s best. I’ll page the provider on-call now. If you haven’t heard from the provider (or me) within 30 minutes, go directly to the ED/UCC at _____________ Hospital.
43. **See HCP Within 4 Hours (or PCP triage):**
   - **If Office Will Be Open:** You need to be seen within the next 3 or 4 hours. Call your doctor (or NP/PA) now or as soon as the office opens.
   - **If Office Will Be Closed and No PCP (Primary Care Provider) Second-Level Triage:** You need to be seen within the next 3 or 4 hours. A nearby Urgent Care Center (UCC) is often a good source of care. Another choice is to go to the ED. Go sooner if you become worse.
   - **If Office Will Be Closed and PCP Second-Level Triage Required:** You may need to be seen. Your doctor (or NP/PA) will want to talk with you to decide what's best. I'll page the on-call provider now. If you haven't heard from the provider (or me) within 30 minutes, call again. **NOTE:** If on-call provider can't be reached, send to UCC or ED.

44. **See PCP Within 24 Hours:**
   - **If Office Will Be Open:** You need to be seen within the next 24 hours. Call your doctor (or NP/PA) when the office opens and make an appointment.
   - **If Office Will Be Closed and No PCP (Primary Care Provider) Second-Level Triage:** You need to be seen within the next 24 hours. A clinic or an urgent care center is often a good source of care if your doctor's office is closed or you can't get an appointment.
   - **If Office Will Be Closed and PCP Second-Level Triage Required:** You may need to be seen within the next 24 hours. Your doctor (or NP/PA) will want to talk with you to decide what's best. I'll page the on-call provider now. **NOTE:** Since this isn't serious, hold the page between 10 pm and 7 am. Page the on-call provider in the morning.
   - **If Patient Has No PCP:** Refer patient to a clinic or urgent care center. Also try to help caller find a PCP for future care.

45. **See PCP Within 3 Days:**
   - You need to be seen within 2 or 3 days. Call your doctor (or NP/PA) during regular office hours and make an appointment. A clinic or urgent care center are good places to go for care if your doctor's office is closed or you can't get an appointment. **NOTE:** If office will be open tomorrow, tell caller to call then, not in 3 days.
   - **If Patient Has No PCP (Primary Care Provider):** A clinic or urgent care center are good places to go for care if you do not have a primary care provider. **NOTE:** Try to help caller find a PCP for future care (e.g., use a physician referral line). Having a PCP or "medical home" means better long-term care.

46. **See PCP Within 2 Weeks:**
   - You need to be seen for this ongoing problem within the next 2 weeks. Call your doctor (or NP/PA) during regular office hours and make an appointment.
   - **If Patient Has No PCP (Primary Care Provider):** A primary care clinic or an urgent care center are good places to go for care if you do not have a primary care provider. **NOTE:** Try to help caller find a PCP (e.g., use a physician referral line). Having a PCP or "medical home" means better long-term care.

47. **Home Care - Information or Advice Only Call.**

48. **Home Care:**
   - You should be able to treat this at home.
49. **Call PCP Now:**
   - You need to discuss this with your doctor (or NP/PA).
   - I'll page the on-call provider now. If you haven't heard from the provider (or me) within 30 minutes, call again.

50. **Call PCP Within 24 Hours:**
   - You need to discuss this with your doctor (or NP/PA) within the next 24 hours.
   - **If Office Will Be Open:** Call the office when it opens tomorrow morning.
   - **If Office Will Be Closed:** I'll page the on-call provider now. **Exception:** from 9 pm to 9 am. Since this isn't urgent, we'll hold the page until morning.

51. **Call PCP When Office Is Open:**
   - You need to discuss this with your doctor (or NP/PA) within the next few days.
   - Call the office when it is open.

52. **Go To L&D Now:**
   - You need to be seen.
   - Go to the Labor and Delivery Unit or the Emergency Department at __________ Hospital.
   - Leave now. Drive carefully.

54. **Call Local Agency Within 24 Hours:**
   - You need to discuss these issues further with someone from a local agency.
   - Call them within the next 24 hours.

90. **Call Back If:**
   - You have more questions.

610. **Alternate Disposition - Local Clinic or Urgent Care Center:**
   - Many clinics and urgent care centers now perform testing.
   - Call ahead or visit their website to schedule a test.

611. **Get a Flu Shot (Influenza Vaccine):**
   - Protect yourself and your family from influenza by getting your annual flu shot (influenza vaccination).
   - All adults should get a flu shot every year. This year is more important than ever.
   - **Reason:** Getting COVID-19 while you also have or are recovering from the flu may increase the chances of getting severe symptoms.
COVID-19 - How to Protect Your Family and Yourself From Getting Sick:
⦁ Avoid close contact with people known to have this new coronavirus infection.
⦁ Avoid close contact with people outside your family unit.
⦁ Avoid closed spaces (indoors) when possible and all crowds (even outdoors).
⦁ When you must leave your home, wear a mask and observe social (safe) distancing.
⦁ Try to stay at least 6 feet (2 meters) away from anyone who is coughing.
⦁ Wash hands often with soap and water.
⦁ Alcohol-based hand cleaners are also effective.
⦁ Avoid touching the eyes, nose or mouth. Germs on the hands can spread this way.
⦁ Do not share eating utensils (e.g., spoon, fork).

COVID-19 - Face Masks for Prevention:
⦁ Face masks are essential for reducing the spread of COVID-19. They will also reduce the spread of influenza. Wearing a mask means you care about other people.
⦁ Sick Patients: People who are sick with COVID-19 must always wear a face mask if they need to leave the home. Example: for medical visits. *Exception:* patients with trouble breathing (CDC). Consider a loose face covering such as a bandana.
⦁ Well People: When community spread is high, the CDC also recommends face masks or coverings for everyone going outside the home. They are critical if entering a public building, such as a grocery store. *Reason:* Many people with COVID-19 have no symptoms but can spread the virus. *Exceptions:* Face mask or covering is optional if outdoors and you can avoid being within 6 feet (2 meters) of other people. Some examples are an outdoor walk or run.
⦁ Age Limits: Face coverings also are not recommended for children under 2 years (CDC).

Keep Your Mind Positive:
⦁ Live in the Present: Live in the present, not the future. The future is where your needless worries live.
⦁ Think Positive: Use a mantra to reduce your fears, such as "I am strong". Stay positive.
⦁ Get Outdoors: Take daily walks. Go to a park if you have one. Being in nature is good for your immune system.
⦁ Stay in Touch With Your Friends and Family: Use regular phone calls and video chats to stay in touch with those you love. Schedule virtual video dinners with friends and family!
**BACKGROUND INFORMATION**

**Key Points**

- An outbreak of this infection began in Wuhan, Hubei Province, China in December 2019.
- The first patient in the United States occurred on January 21, 2020. During March 2020 cases were identified in all states.
- Four patients were confirmed in Canada on January 31, 2020.
- The **Centers for Disease Control and Prevention** (CDC) is considered the source of truth for this guideline. This continues to be a rapidly changing situation and guidance from the CDC is being updated daily. See [https://www.cdc.gov/coronavirus/2019-nCoV/index.html](https://www.cdc.gov/coronavirus/2019-nCoV/index.html).

**Symptoms**

The COVID-19 coronavirus most often causes a lower respiratory tract illness. More common symptoms are:

- **Anorexia** (40-84%)
- **Chills** (16-28%)
- **Cough** (59-82%)
- **Fatigue** (44-70%)
- **Fever** (83-99%)
- **Loss of smell or taste** (40-50%)
- **Muscle pain** (11-35%)
- **Shortness of breath or difficulty breathing** (31-40%)
Other symptoms may include:

- Diarrhea (2-5%)
- Headache (5-14%)
- Nausea or Vomiting (1-10%)
- Runny or Stuffy Nose (4%)
- Sore Throat (5%)
- Sputum production (14-34%)

Having two or more of any of these symptoms increases the likelihood that a person may have COVID-19.

Over 30% of infected adult patients have no symptoms (asymptomatic). Children and teens are even more likely to have no symptoms.

**Cause**

It is caused by a novel (new) coronavirus (COVID-19).

**How it is Spread (Transmission)**

COVID-19 is spread from person to person.

- **Respiratory Droplets:** The virus spreads from respiratory droplets that are produced when a person coughs, sneezes, shouts, or sings. The infected droplets can then be inhaled by a nearby person or land on the surface of their face or eyes. Droplets fall quickly to the floor or ground. This is how most COVID is spread.
- **Surfaces:** Most infected people also have respiratory secretions on their hands. These secretions get transferred to healthy people on doorknobs, faucet handles, etc. The virus then gets transferred to healthy people when they touch their face or rub their eyes. This is a less common cause of spread.
- **Aerosols:** Aerosols are tiny, invisible particles that can float in the air for 1 to 2 hours and travel more than 6 feet (2 meters). They can occur in a closed room with poor ventilation. Aerosols are a rare cause of COVID-19 spread.

**Exposure Risk Factors**

Risk factors for getting sick with COVID-19 are:

- **Close contact with a person** who tested positive for COVID-19 AND contact occurred while they were ill. Close contact is defined as being within 6 feet (2 meters) of an infected person for a total of 15 minutes or more in a 24-hour period. This includes living with someone infected with COVID-19.
- **Living in or travel from a city** or area where there is community spread of COVID-19. This carries a lower risk compared to close contact if one follows physical distancing recommendations. Community spread is now occurring in most of the US, especially in cities.
- **International Travel:** The CDC [https://www.cdc.gov/coronavirus/2019-ncov/travelers](https://www.cdc.gov/coronavirus/2019-ncov/travelers) has the most up-to-date list of where COVID-19 outbreaks are occurring.

**Reducing Exposure Risk - Going Out in Public**

The risk of COVID-19 spread increases with how closely a person interacts with others, how many people there are, and the longer the interaction.

A person should take the following precautions whenever they go out:
• A cloth face-covering
• Hand sanitizer with at least 60% alcohol

Reducing Exposure Risk - Travel

• Avoid all non-essential travel.
• If you must travel, go to the CDC website for updates on travel advisories: https://www.cdc.gov/coronavirus/2019-ncov/travelers.

Incubation Period

The incubation period averages 5 days (range 2 to 14 days) after coming in contact with the secretions of a person who has COVID-19.

Testing

There are two types of tests for COVID-19: viral tests and antibody tests.

• **Test for Current Infection - Viral Test:** A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva sample.

• **Test for Past Infection - Antibody Test:** An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample. An antibody test may not be able to show if you have a current infection, because it can take 1 to 3 weeks for your body to make antibodies to the infection. We do not know yet if having antibodies to the virus can protect someone from getting infected with the virus again, or how long that protection might last.

The results usually come back in 1 to 4 days, but may take longer depending on testing kit or testing site availability.

When should testing be performed?

• **People Who Have Symptoms of COVID-19:** A person who is symptomatic should get a COVID-19 viral test within 3 days.

• **People With Close Contact Exposure:** A person who had a close contact COVID-19 exposure and is asymptomatic should get a COVID-19 viral test about 5 to 7 days after exposure.

For questions about testing, it is often best to direct the patient to their HCP (doctor, NP, PA) during office hours. The HCP is the best resource for up-to-date information on testing. National and state testing recommendations continue to change. *Testing requires a HCP’s order (as with all medical tests).*

Diagnosis and Reporting

Clinicians should report positive test results to infection control at their health system and to their local or state health department.

Complications

Complications include pneumonia, hypoxia, ARDS, respiratory failure, and death.

The following two groups of individuals are considered as **HIGH RISK** in this guideline.
1. People with the following medical problems or conditions are at **highest** risk of complications.

- **Age:** The risk for severe illness from COVID-19 increases with age, with older adults at highest risk.
- Cancer
- Chronic kidney disease
- Heart disease, such as heart failure, coronary artery disease
- Obesity with a body mass index (BMI) of 30 or higher
- Sickle cell disease
- Smoking
- Solid organ transplant
- Type 2 diabetes

2. According to the CDC, people with the following medical conditions might be at **higher** risk of severe illness from COVID-19 (or from influenza).

- Asthma (moderate-to-severe)
- Cerebrovascular disease (affects blood vessels and blood supply to the brain)
- Cystic fibrosis
- Hypertension or high blood pressure
- Immunocompromised state (weak immune system) from blood or bone marrow transplant, immune deficiencies, HIV, use of corticosteroids, or use of other immune weakening medicines
- Liver disease
- Neurologic conditions, such as dementia
- Pregnancy
- Pulmonary fibrosis (having damaged or scarred lung tissues)
- Thalassemia (a type of blood disorder)
- Type 1 diabetes

The adult death rate for COVID-19 is approximately 1% to 3%. The death rate is lower in children and younger adults. It is higher in older adults.

**Treatment**

Treatment is supportive. Oxygen and IV fluids are used for hospitalized patients. **Steroid medications** are used in some hospitalized patients.

On May 1, 2020 the U.S. Food and Drug Administration (FDA) granted temporary emergency use authorization (EUA) for the investigational antiviral **remdesivir** to treat COVID-19. Doctors can use this drug to treat patients who are hospitalized with COVID-19 who are severely ill. More research is needed to determine how well this drug works and for which patients.

On November 11, 2020 the FDA issued an EUA for the investigational monoclonal antibody therapy **bamlanivimab** for the treatment of mild-to-moderate COVID-19 in adult and pediatric patients.

**Prevention**

Social distancing and wearing masks have been proven to help prevent COVID-19.

**Vaccination**

Several COVID-19 vaccines have been approved or are nearing approval for use in Canada and the United States:
There are many COVID-19 vaccines still in development.

Quarantine vs. Isolation

The term quarantine means to keep someone who might have been exposed to COVID-19 away from others. Quarantine helps prevent the spread of COVID-19 because a person with COVID-19 can spread the virus before they get sick. Also, some people can get COVID-19 and have no symptoms.

How long should a person isolate after being exposed to COVID-19? The best and safest approach is to stay at home and quarantine for 14 days. In December 2020, the CDC outlined two new optional strategies for determining quarantine duration for asymptomatic people after COVID-19 exposure:

- **Option 1:** Quarantine for only 10 days (without COVID-19 viral testing).
- **Option 2:** Get a negative viral COVID-19 test on day 5 to 7 after exposure and quarantine for only 7 days.
- With either option, continue to watch for symptoms and wear a mask for 14 days after the exposure.

The term isolation means to keep someone who is infected with COVID-19 away from others. Isolation helps prevent the spread of COVID-19 to people.

How long should a person quarantine after getting infected with COVID-19? A person must meet all 3 of these requirements to end the quarantine period:

- Fever gone for at least 24 hours off fever-reducing medicines **AND**
- Cough and other symptoms must be improved **AND**
- Symptoms started more than 10 days ago.
- If unsure if it is safe for you to leave isolation, check the CDC website or call your healthcare provider.

Ibuprofen and Other NSAID Use for COVID-19

Some callers have expressed concerns that ibuprofen (or other NSAID) use to treat COVID-19 symptoms may worsen the disease. These concerns originated from a few physicians' comments and have since spread over social media.

To date, there is no scientific evidence (clinical trials or studies) that show that using ibuprofen negatively impacts outcome in COVID-19 patients. We will continue to review any new literature as it is published. The CDC, WHO, AAP and our Infectious Disease expert reviewers continue to approve the use of ibuprofen for COVID-19.

For these reasons, Schmitt-Thompson Clinical Content (STCC) guidelines continue to recommend ibuprofen as an acceptable way to treat high fevers and pain.

- Remind callers that fevers may be beneficial, help fight the infection, and speed recovery.
- Low-grade fevers should not be treated.
If callers remain concerned, they can use acetaminophen for symptoms that warrant treatment.

Caution: For suspected COVID-19 patients on oral steroids, such as prednisone, the triager should involve the HCP for a decision about whether the drug can be continued.

Other Coronaviruses in Humans

Common coronaviruses can cause colds and upper respiratory symptoms. These can be identified in currently available commercial respiratory testing panels (human coronaviruses HKU1, OC43, 229E, and OC43). These coronaviruses are completely different than the novel coronavirus addressed in this guideline.

Two other coronaviruses that previously have caused serious outbreaks are:

- MERS-CoV: Middle East Respiratory Syndrome (MERS)
- SARS-CoV: Severe Acute Respiratory Syndrome (SARS)

Animals and COVID-19

- The main way COVID-19 spreads is from person to person. There is low risk of getting COVID-19 from a pet or other animal.
- It is possible for animals to catch COVID-19 from people. A few pets have tested positive for COVID-19 (including cats and dogs).
- The CDC recommends treating pets like other family members when trying to avoid spreading COVID-19. Do not let pets have close contact with other people or animals outside your household. A sick person should self-isolate and avoid contact with both people and pets.
- Call your vet if your pet gets sick or you have other questions.
- The CDC has more information on COVID-19 and animals at: https://www.cdc.gov/coronavirus/2019-ncov/daily-life-coping/animals.html.
