Coronavirus (COVID-19) - Diagnosed or Suspected

Office Hours Telephone Triage Protocols | Adult | 2020

**DEFINITION**

- Diagnosis was confirmed by **positive lab test** OR
- **Clinical diagnosis** (suspected diagnosis) was made by healthcare provider (HCP) OR
- **Patient or caregiver suspects COVID-19** based on symptoms consistent with COVID-19 and recalls close contact with a person with COVID-19 in past two weeks, or is living in an area of community spread.

**Note to Triager:**

- Triagers should use their clinical judgment, but generally will want to use the **COVID-19 Diagnosed or Suspected** guideline when a patient calls with cough, fever, shortness of breath, or a combination of typical COVID symptoms and there is community spread.
- During the 2020-2021 influenza season, triagers can use the **COVID-19 Diagnosed or Suspected** guideline when a patient calls with flu-like symptoms.
- In adult patients triager should use clinical judgment to decide whether a symptom guideline (e.g., Chest Pain, Fever, Headache) should be used in addition to the **COVID-19 Diagnosed or Suspected** guideline when a patient calls with flu-like symptoms. Adults (and especially older adults) are more likely to have one or more chronic underlying medical conditions. Increased age is also a strong risk factor for severe COVID-19 illness and complications. Further, fever as a marker of important pathology increases significantly by age in adults.

This guideline was **last updated** 1/3/2021.

**TRIAGE ASSESSMENT QUESTIONS**

**Call EMS 911 Now**

- SEVERE difficulty breathing (e.g., struggling for each breath, speaks in single words)
  
  _R/O: respiratory failure, hypoxia. Note to triager: Tell caller to TELL 911 dispatcher and medics about possible COVID-19 exposure._

- Difficult to awaken or acting confused (e.g., disoriented, slurred speech)
  
  _R/O: hypoxia, sepsis. Note to triager: Tell caller to TELL 911 dispatcher and medics about possible COVID-19 exposure._

- Bluish (or gray) lips or face now
  
  _R/O: cyanosis and need for oxygen. Note to triager: Tell caller to TELL 911 dispatcher and medics about possible COVID-19 exposure._

- Shock suspected (e.g., cold/pale/clammy skin, too weak to stand, low BP, rapid pulse)
  
  _R/O: shock. Note to triager: Tell caller to TELL 911 dispatcher and medics about possible COVID-19 exposure._

- Sounds like a life-threatening emergency to the triager
  
  _Note to triager: Tell caller to TELL 911 dispatcher and medics about possible COVID-19 exposure._
See More Appropriate Protocol

  
  Go to Protocol: Coronavirus (COVID-19) - Exposure (Adult)

- [1] Lives with someone known to have influenza (flu test positive) AND [2] flu-like symptoms (e.g., cough, runny nose, sore throat, SOB; with or without fever)
  
  Go to Protocol: Influenza - Seasonal (Adult). Note: patient is more likely to have flu than COVID-19 if they are living with someone who tested positive for influenza.

  
  Note to Triager: First use this protocol. In adult patients triager should then use clinical judgment to decide whether a symptom protocol (e.g., Chest Pain, Fever, Headache) should also be used.

- COVID-19 vaccine reaction suspected (e.g., fever, headache, muscle aches) occurring during days 1-3 after getting vaccine
  
  Go to Protocol: Coronavirus (COVID-19) - Vaccine Questions and Reactions (Adult)

- COVID-19 vaccine, questions about
  
  Go to Protocol: Coronavirus (COVID-19) - Vaccine Questions and Reactions (Adult)

- COVID-19 and breastfeeding, questions about
  
  Go to Protocol: Coronavirus (COVID-19) - Diagnosed or Suspected (Pediatric)

Go to ED Now

- SEVERE or constant chest pain or pressure (Exception: mild central chest pain, present only when coughing)
  
  R/O: pneumonia, pleurisy. Note to Triager: Consider using both this protocol AND the Chest Pain protocol if any concern for cardiac or other more serious cause of chest pain. Call ahead to the ED.

- MODERATE difficulty breathing (e.g., speaks in phrases, SOB even at rest, pulse 100-120)
  
  R/O: pneumonia. Note to triager: Call ahead to the ED.

- Headache and stiff neck (can't touch chin to chest)

Go to ED/UCC Now (or to Office with PCP Approval)

- MILD difficulty breathing (e.g., minimal/no SOB at rest, SOB with walking, pulse <100)
  
  R/O: pneumonia. Note: not from stuffy nose (e.g., not relieved by cleaning out the nose). Note: Call ahead to location where patient will go for care.

- Chest pain or pressure
  
  R/O: pneumonia, pleurisy, chest discomfort from COVID-19. Note: Call ahead to location where patient will go for care.

- Patient sounds very sick or weak to the triager
  
  Reason: severe acute illness or serious complication suspected. Note: Call ahead to location where patient will go for care.

Discuss with PCP and Callback by Nurse within 1 Hour

- Fever > 103° F (39.4° C)
  
  R/O: serious bacterial infection.
*R/O: pneumonia*

[1] Fever > 100.0° F (37.8° C) AND [2] bedridden (e.g., nursing home patient, CVA, chronic illness, recovering from surgery)  
*R/O: pneumonia*

[1] HIGH RISK patient (e.g., age > 64 years, diabetes, heart or lung disease, weak immune system) AND [2] new or worsening symptoms  
*Note: HIGH RISK is defined in Background area of this protocol.*

*Reason: During an influenza outbreak, treatment with anti-viral influenza medication should be considered for HIGH RISK patients, especially for symptoms present < 48 hours. PCP may wish to phone in a prescription to the pharmacy. Testing for both COVID-19 and influenza may be needed.*

*Reason: During an influenza outbreak, treatment with anti-viral influenza medication should be considered for HIGH RISK patients, especially for symptoms present < 48 hours. PCP may wish to phone in a prescription to the pharmacy. Testing for both COVID-19 and influenza may be needed.*

**Discuss with PCP and Callback by Nurse Today**

*Reason: PCP will discuss suspected diagnosis and need for testing*

Fever present > 3 days (72 hours)  
*R/O: bacterial sinusitis, bronchitis, pneumonia*

*R/O: bacterial sinusitis, bronchitis, pneumonia*

[1] Continuous (nonstop) coughing interferes with work or school AND [2] no improvement using cough treatment per protocol

Cough present > 3 weeks

**Home Care**

[1] COVID-19 diagnosed by HCP (doctor, NP or PA) AND [2] mild symptoms (e.g., cough, fever, others) AND [3] no complications or SOB

COVID-19 Home Isolation, questions about  
*Note: How to protect others when you are sick.*

COVID-19 Testing, questions about
HOME CARE ADVICE

Treating the Symptoms When You Have Been Diagnosed with COVID-19

1. **Reassurance and Education - Diagnosed With COVID-19 by Health Care Provider (HCP) and Mild Symptoms:**
   - Your HCP has diagnosed you as having COVID-19 based on your symptoms and other information.
   - You may or may have not been tested for COVID-19. People with mild symptoms sometimes do not need testing. It does not change treatment.
   - The symptoms of COVID-19 can be mild, especially if you are healthy and under 65 years old.
   - Here’s some care advice to help you and to help prevent others from getting sick.

2. **General Care Advice for COVID-19 Symptoms:**
   - The treatment is the same whether you have COVID-19, influenza or some other respiratory virus.
     - **Cough:** Use cough drops.
     - **Feeling dehydrated:** Drink extra liquids. If the air in your home is dry, use a humidifier.
     - **Fever:** For fever over 101 F (38.3 C), take acetaminophen every 4 to 6 hours (Adults 650 mg) OR ibuprofen every 6-8 hours (Adults 400 mg). Before taking any medicine, read all the instructions on the package. Do not take aspirin unless your doctor has prescribed it for you.
     - **Muscle aches, headache, and other pains:** Often this comes and goes with the fever. Take acetaminophen every 4-6 hours (Adults 650 mg) OR ibuprofen every 6 to 8 hours (Adults 400 mg). Before taking any medicine, read all the instructions on the package.
     - **Sore throat:** Try throat lozenges, hard candy or warm chicken broth.

3. **Cough Medicines:**
   - **OTC Cough Syrups:** The most common cough suppressant in OTC cough medications is dextromethorphan. Often the letters “DM” appear in the name.
   - **OTC Cough Drops:** Cough drops can help a lot, especially for mild coughs. They reduce coughing by soothing your irritated throat and removing that tickle sensation in the back of the throat. Cough drops also have the advantage of portability - you can carry them with you.
   - **Home Remedy - Hard Candy:** Hard candy works just as well as medicine-flavored OTC cough drops. People who have diabetes should use sugar-free candy.
   - **Home Remedy - Honey:** This old home remedy has been shown to help decrease coughing at night. The adult dosage is 2 teaspoons (10 ml) at bedtime. Honey should not be given to infants under one year of age.

4. **Caution - Dextromethorphan:**
   - Do not try to completely suppress coughs that produce mucus and phlegm. Remember that coughing is helpful in bringing up mucus from the lungs and preventing pneumonia.
   - **Research Notes:** Dextromethorphan in some research studies has been shown to reduce the frequency and severity of cough in adults (18 years or older) without significant adverse effects. However, other studies suggest that dextromethorphan is no better than placebo at reducing a cough.
   - **Drug Abuse Potential:** It should be noted that dextromethorphan has become a drug of abuse. This problem is seen most often in adolescents. Overdose symptoms can range from giggling...
and euphoria to hallucinations and coma.

- **Contraindicated:** Do not take dextromethorphan if you are taking a monoamine oxidase (MAO) inhibitor now or in the past 2 weeks. Examples of MAO inhibitors include isocarboxazid (Marplan), phenelzine (Nardil), selegiline (Eldepryl, Emsam, Zelapar), and tranylcypromine (Parnate). Do not take dextromethorphan if you are taking venlafaxine (Effexor).

5. **Use a Humidifier:**
   - If the air in your home is dry, use a cool-mist humidifier.
   - *Reason:* dry air makes coughs worse.

6. **Coughing Spells:**
   - Drink warm fluids. Inhale warm mist. (*Reason:* both relax the airway and loosen up the phlegm)
   - Suck on cough drops or hard candy to coat the irritated throat.

7. **Pain and Fever Medicines:**
   - For pain or fever relief, take either acetaminophen or ibuprofen.
   - They are over-the-counter (OTC) drugs that help treat both fever and pain. You can buy them at the drugstore.
   - Treat fevers above 101° F (38.3° C). The goal of fever therapy is to bring the fever down to a comfortable level. Remember that fever medicine usually lowers fever 2 degrees F (1 - 1 1/2 degrees C).
   - **Acetaminophen Regular Strength Tylenol:** Take 650 mg (two 325 mg pills) by mouth every 4 to 6 hours as needed. Each Regular Strength Tylenol pill has 325 mg of acetaminophen. The most you should take each day is 3,250 mg (10 pills a day).
   - **Acetaminophen - Extra Strength Tylenol:** Take 1,000 mg (two 500 mg pills) every 8 hours as needed. Each Extra Strength Tylenol pill has 500 mg of acetaminophen. The most you should take each day is 3,000 mg (6 pills a day).
   - **Ibuprofen (e.g., Motrin, Advil):** Take 400 mg (two 200 mg pills) by mouth every 6 hours. The most you should take each day is 1,200 mg (six 200 mg pills), unless your doctor has told you to take more.

8. **Pain and Fever Medicines - Extra Notes and Warnings:**
   - Use the lowest amount of medicine that makes your pain or fever better.
   - Acetaminophen is thought to be safer than ibuprofen or naproxen in people over 65 years old. Acetaminophen is in many OTC and prescription medicines. It might be in more than one medicine that you are taking. You need to be careful and not take an overdose. An acetaminophen overdose can hurt the liver.
   - McNeil, the company that makes Tylenol, has different dosage instructions for Tylenol in Canada and the United States. In Canada, the maximum recommended dose per day is 4,000 mg or twelve Regular-Strength (325 mg) pills. In the United States, McNeil recommends a maximum dose of ten Regular-Strength (325 mg) pills.
   - **Caution:** Do not take acetaminophen if you have liver disease.
   - **Caution:** Do not take ibuprofen if you have stomach problems, kidney disease, are pregnant, or have been told by your doctor to avoid this type of anti-inflammatory drug. Do not take ibuprofen for more than 7 days without consulting your doctor.
   - **Before taking any medicine, read all the instructions on the package.**

9. **Note to Triager - Ibuprofen Concerns:**
   - Discuss only if caller brings up concerns about ibuprofen.
   - **Response:** The CDC, WHO, and other experts continue to support the use of ibuprofen (if needed) for patients with COVID-19. They found no scientific evidence to support the claim that ibuprofen made COVID-19 worse.
10. Call Back If:
   • Fever over 103°F (39.4°C)
   • Fever lasts over 3 days
   • Fever returns after being gone for 24 hours
   • Chest pain or difficulty breathing occurs
   • You become worse

COVID-19 General Information

1. COVID-19 (Coronavirus Disease 2019) - Outbreak:
   • An outbreak of this infection began in China in December 2019.
   • The first patient in the United States occurred on January 21, 2020.
   • Four patients were confirmed in Canada on January 31, 2020.
   • The World Health Organization (WHO) declared COVID-19 a global public health emergency on January 30, 2020 and then a pandemic on March 11, 2020.
   • The Centers for Disease Control and Prevention (CDC) is considered the source of truth for this guideline. This continues to be a rapidly changing situation and guidance from the CDC is being updated daily. See https://www.cdc.gov/coronavirus/2019-nCoV/index.html.

2. COVID-19 - Symptoms:
   • COVID-19 most often causes a respiratory illness.
   • The most common symptoms are: cough, fever, and shortness of breath.
   • Other less common symptoms are: chills, fatigue, headache, loss of smell or taste, muscle pain, and sore throat.
   • Some people may have minimal symptoms or even have no symptoms (asymptomatic).

3. COVID-19 - Exposure Risk Factors:
   • Close contact with a person who tested positive for COVID-19 AND contact occurred while they were ill. Close contact means being within 6 feet (2 meters) for a total of 15 minutes or more in a 24-hour period. This includes living with someone infected with COVID-19.
   • Living in or travel from a city or area where there is community spread of COVID-19. This carries a lower risk compared to close contact if one follows physical distancing recommendations. Community spread has occurred in most of the US, especially in cities.
   • International Travel: The CDC (https://www.cdc.gov/coronavirus/2019-ncov/travelers) has the most up-to-date list of where COVID-19 outbreaks are occurring.

4. COVID-19 - How It Is Spread:
   • COVID-19 is spread from person to person.
   • Respiratory Droplets: The virus spreads from respiratory droplets that are produced when a person coughs, sneezes, shouts, or sings. The infected droplets can then be inhaled by a nearby person or land on the surface of their face or eyes. Droplets fall quickly to the floor or ground. This is how most COVID is spread.
   • Surfaces: Most infected people also have respiratory secretions on their hands. These secretions get transferred to healthy people on doorknobs, faucet handles, etc. The virus then gets transferred to healthy people when they touch their face or rub their eyes. This is a less common cause of spread.
   • Aerosols: Aerosols are tiny, invisible particles that can float in the air for 1 to 2 hours and travel more than 6 feet (2 meters). They only occur in a closed room with poor ventilation. Aerosols are a rare cause of COVID-19 spread.

5. COVID-19 - How to Protect Your Family and Yourself From Getting Sick:
   • Avoid close contact with people known to have this new coronavirus infection.
• Avoid close contact with people outside your family unit.
• Avoid closed spaces (indoors) when possible and all crowds (even outdoors).
• When you must leave your home, wear a mask and observe social (safe) distancing.
• Try to stay at least 6 feet (2 meters) away from anyone who is coughing.
• Wash hands often with soap and water.
• Alcohol-based hand cleaners are also effective.
• Avoid touching the eyes, nose or mouth. Germs on the hands can spread this way.
• Do not share eating utensils (e.g., spoon, fork).

6. How to Protect Others - When You are Sick with COVID-19:
• Stay Home a Minimum of 10 Days: Home isolation is needed for at least 10 days after the symptoms started. Stay home from school or work if you are sick. Do Not go to religious services, child care centers, shopping, or other public places. Do Not use public transportation (e.g., bus, taxis, ride-sharing). Do Not allow any visitors to your home. Leave the house only if you need to seek urgent medical care.
• Cover the Cough: Cough and sneeze into your shirt sleeve or inner elbow. Don't cough into your hand or the air. If available, cough into a tissue and throw it into a trash can.
• Wash Hands Often: Wash hands often with soap and water. After coughing or sneezing are important times. If soap and water are not available, use an alcohol-based hand sanitizer with at least 60% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry. Avoid touching your eyes, nose, and mouth with unwashed hands.
• Wear a Mask: Wear a facemask when around others. Always wear a facemask (if available) if you have to leave your home (such as going to a medical facility).
• Call First if Medical Care Needed: Call ahead to get approval and careful directions.

7. COVID-19 - Travel Guidelines:
• The Centers for Disease Control and Prevention (CDC) maintains a website with latest recommendations regarding travel and your health.
• Currently the CDC recommends against travel to many geographic areas with widespread and ongoing spread of COVID-19. See current list at https://wwwnc.cdc.gov/travel/.
• CDC Travel Health Website: https://wwwnc.cdc.gov/travel/.
• CDC Travel FAQs: https://www.cdc.gov/coronavirus/2019-ncov/travelers/faqs.html

8. COVID-19 - What Types of Tests Are Available?
• There are two types of tests available for COVID-19: viral tests and antibody tests.
• Test for Current Infection - Viral Test: A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva sample. Symptomatic patients should get a test within 3 days, if available. Asymptomatic people with a close contact COVID-19 exposure should get the viral test on day 6 to 8 after exposure.
• Test for Past Infection - Antibody Test: An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample. An antibody test may not be able to show if you have a current infection, because it can take 1 to 3 weeks for your body to make antibodies to the infection. We do not know yet if having antibodies to the virus can protect someone from getting infected with the virus again, or how long that protection might last. If an antibody test is needed, it is usually performed 2 to 3 weeks after the start of the infection.
• The results usually come back in 1 to 3 days, but may take longer depending on testing kit or testing site availability.

9. COVID-19 - Face Masks for Prevention:
• Face masks are essential for reducing the spread of COVID-19. They will also reduce the spread of influenza. Wearing a mask means you care about other people.
• Sick Patients: People who are sick with COVID-19 must always wear a face mask if they need to leave the home. Example: for medical visits. Exception: patients with trouble breathing
Consider a loose face covering such as a bandana.

- **Well People:** When community spread is high, the CDC also recommends face masks or coverings for everyone going outside the home. They are critical if entering a public building, such as a grocery store. **Reason:** Many people with COVID-19 have no symptoms but can spread the virus. **Exceptions:** Face mask or covering is optional if outdoors and you can avoid being within 6 feet (2 meters) of other people. Some examples are an outdoor walk or run.

- **Age Limits:** Face coverings also are not recommended for children under 2 years (CDC).

10. **COVID-19 - Going to the ER or Urgent Care Center:**

- If you or your child needs to be seen for an urgent medical problem, do not hesitate to go.
- ERs and urgent care centers are safe places. They are well equipped to protect you against the virus.
- For non-urgent conditions, call us (your healthcare provider's office) first.

11. **Other COVID-19 Facts:**

- **Incubation Period:** Average 5 days (range 2 to 14 days) after coming in contact with a person who has COVID-19 virus.
- **No Symptoms, but Infected (Asymptomatic):** Approximately 30% of infected patients may have no symptoms.
- **Mild Infections:** About 80% of those with symptoms have a mild illness, much like a normal flu or a bad cold. The symptoms usually last 2 weeks.
- **Severe Infections:** About 20% of those with symptoms develop trouble breathing from viral pneumonia. Many of these need to be admitted to the hospital. People with complications generally recover in 3 to 6 weeks.
- **Death Rate:** The adult death rate is approximately 1% to 3%. The death rate is lower in children and younger adults. It is higher in older adults.
- **Treatment:** Treatment is supportive. Oxygen and IV fluids are used for hospitalized patients. On May 1, 2020 the U.S. Food and Drug Administration (FDA) granted temporary emergency use authorization (EUA) for the investigational antiviral remdesivir to treat COVID-19. Doctors can use this drug to treat patients who are hospitalized with COVID-19 who are severely ill. More research is needed to determine how well this drug works and for which patients.
- **Prevention - Vaccine:** Two vaccines have been approved and released for use in the United States and Canada as of December 2020. Other vaccines are in development.
- **Prevention - Medicine:** Currently, there is no medicine to prevent COVID-19. Warning: the malaria drug (chloroquine) was studied and found not to be helpful for this disease. It also had cardiac side effects. *Social distancing and wearing masks have been proven to help prevent COVID-19!*

12. **Call Back If:**

- You have more questions

**COVID-19 Home Isolation and Protecting Others**

1. **How to Protect Others - When You are Sick with COVID-19:**

- **Stay Home a Minimum of 10 Days:** Home isolation is needed for at least 10 days after the symptoms started. Stay home from school or work if you are sick. Do **Not** go to religious services, child care centers, shopping, or other public places. Do **Not** use public transportation (e.g., bus, taxis, ride-sharing). Do **Not** allow any visitors to your home. Leave the house only if you need to seek urgent medical care.
- **Cover the Cough:** Cough and sneeze into your shirt sleeve or inner elbow. Don't cough into your hand or the air. If available, cough into a tissue and throw it into a trash can.
• **Wash Hands Often:** Wash hands often with soap and water. After coughing or sneezing are important times. If soap and water are not available, use an alcohol-based hand sanitizer with at least 60% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry. Avoid touching your eyes, nose, and mouth with unwashed hands.
• **Wear a Mask:** Wear a facemask when around others. Always wear a facemask (if available) if you have to leave your home (such as going to a medical facility).
• **Call First if Medical Care Needed:** Call ahead to get approval and careful directions.

2. **Clean Your Hands Often:**
   • **Wash Hands:** Wash your hands often with soap and water for at least 20 seconds. This is especially important after blowing your nose, coughing, or sneezing; going to the bathroom; and before eating or preparing food.
   • **Use Hand Sanitizer:** If soap and water are not available, use an alcohol-based hand sanitizer with at least 60% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry.
     • Avoid touching your eyes, nose, and mouth with unwashed hands.

3. **Clean "High Touch" Surfaces Every Day:**
   • Clean high-touch surfaces in your isolation area ("sick room" and bathroom) every day.
   • High-touch surfaces include phones, remote controls, counters, tabletops, doorknobs, bathroom fixtures, toilets, keyboards, tablets, and bedside tables.

4. **Stay Away from Others in Your Home:**
   • If possible, stay in a specific "sick room" and away from other people in your home.
   • Use a separate bathroom, if available.

5. **Call Ahead Before Visiting Your Healthcare Provider (Doctor, NP, PA):**
   • Call ahead: If you have a medical appointment, call your doctor's office or emergency department, and tell them you have or may have COVID-19.
   • This will help the office protect themselves and other patients.
   • Wear a facemask.

6. **Stopping Home Isolation - Talk to Your Healthcare Provider:**
   • Talk to your healthcare provider.
   • The decision to stop home isolation if you are sick with COVID-19 should be made by your healthcare provider in consultation with the local health departments.
   • Local decisions depend on local circumstances.

7. **Stopping Home Isolation - Must Meet all 3 Requirements (CDC):**
   • Fever gone for at least 24 hours off fever-reducing medicines AND
   • Cough and other symptoms must be improved AND
   • Symptoms started more than 10 days ago.
   • If unsure if it is safe for you to leave isolation, check the CDC website or call your healthcare provider.

8. **How and When to Stop Home Isolation:**
   • Talk to your healthcare provider.
   • The decision to stop home isolation should be made by your healthcare provider in consultation with the local health departments. Local decisions depend on local circumstances.

9. **Call Back If:**
   • You have more questions

**COVID-19 Prevention and Healthy Living**
1. **COVID-19 - Face Masks for Prevention:**
   - Face masks are essential for reducing the spread of COVID-19. They will also reduce the spread of influenza. Wearing a mask means you care about other people.
   - **Sick Patients:** People who are sick with COVID-19 must always wear a face mask if they need to leave the home. Example: for medical visits. *Exception:* patients with trouble breathing (CDC). Consider a loose face covering such as a bandana.
   - **Well People:** When community spread is high, the CDC also recommends face masks or coverings for everyone going outside the home. They are critical if entering a public building, such as a grocery store. *Reason:* Many people with COVID-19 have no symptoms but can spread the virus. *Exceptions:* Face mask or covering is optional if outdoors and you can avoid being within 6 feet (2 meters) of other people. Some examples are an outdoor walk or run.
   - **Age Limits:** Face coverings also are not recommended for children under 2 years (CDC).

2. **COVID-19 - How to Protect Your Family and Yourself From Getting Sick:**
   - *Avoid close contact with people known to have this new coronavirus infection.*
   - *Avoid close contact with people outside your family unit.*
   - Avoid closed spaces (indoors) when possible and all crowds (even outdoors).
   - When you must leave your home, wear a mask and observe social (safe) distancing.
   - Try to stay at least 6 feet (2 meters) away from anyone who is coughing.
   - Wash hands often with soap and water.
   - Alcohol-based hand cleaners are also effective.
   - Avoid touching the eyes, nose or mouth. Germs on the hands can spread this way.
   - Do not share eating utensils (e.g., spoon, fork).

3. **Keep Your Mind Positive:**
   - **Live in the Present:** Live in the present, not the future. The future is where your needless worries live.
   - **Think Positive:** Use a mantra to reduce your fears, such as "I am strong". Stay positive.
   - **Get Outdoors:** Take daily walks. Go to a park if you have one. Being in nature is good for your immune system.
   - **Stay in Touch with Your Friends and Family:** Use regular phone calls and video chats to stay in touch with those you love. Schedule virtual video dinners with friends and family!

4. **Keep Your Body Strong:**
   - Get your body ready to fight the COVID-19 virus.
   - Get enough sleep.
   - Stay physically active. Walk or exercise every day. Take the stairs.
   - Stay well hydrated.
   - Eat healthy meals. Avoid overeating to deal with your fears.
   - Avoid the over-use of anti-fever medicines. Fever helps fight infections and ramps up your immune system.

5. **Ask for Help:**
   - If you feel so sad or worried that you cannot function, reach out to your health care provider, local mental health center, or national helpline.
   - **Canada:** In Canada, crisis and mental health support is available at: https://www.canada.ca/en/public-health/services/mental-health-services/mental-health-get-help.html.
   - **United States - SAMHSA:** 1-800-662-HELP (4357). Website: www.samhsa.gov/find-
6. **Get a Flu Shot (Influenza Vaccine):**
   - Protect yourself and your family from influenza by getting your annual flu shot (influenza vaccination).
   - All adults should get a flu shot every year. This year is more important than ever. **Reason:** Getting COVID-19 while you also have or are recovering from the flu may increase the chances of getting severe symptoms.

7. **How to Protect Others - When You are Sick with COVID-19:**
   - **Stay Home a Minimum of 10 Days:** Home isolation is needed for at least 10 days after the symptoms started. Stay home from school or work if you are sick. Do **Not** go to religious services, child care centers, shopping, or other public places. Do **Not** use public transportation (e.g., bus, taxis, ride-sharing). Do **Not** allow any visitors to your home. Leave the house only if you need to seek urgent medical care.
   - **Cover the Cough:** Cough and sneeze into your shirt sleeve or inner elbow. Don’t cough into your hand or the air. If available, cough into a tissue and throw it into a trash can.
   - **Wash Hands Often:** Wash hands often with soap and water. After coughing or sneezing are important times. If soap and water are not available, use an alcohol-based hand sanitizer with at least 60% alcohol, covering all surfaces of your hands and rubbing them together until they feel dry. Avoid touching your eyes, nose, and mouth with unwashed hands.
   - **Wear a Mask:** Wear a facemask when around others. Always wear a facemask (if available) if you have to leave your home (such as going to a medical facility).
   - **Call First if Medical Care Needed:** Call ahead to get approval and careful directions.

8. **Call Back If:**
   - You have more questions

**COVID-19 Testing and Test Results**

1. **Note to Triager - COVID-19 Testing:**
   - **For questions about testing, it is best to direct the patient to their HCP** (doctor, NP, PA) during office hours. The HCP is the best resource for up-to-date information on testing. This is a somewhat complicated decision process. National and state testing recommendations continue to change. **Testing requires a HCP’s order (as with all medical tests).**
   - COVID-19 testing is becoming more available from local and state public health departments. Commercial labs now can perform COVID-19 testing. However, it may still be difficult to find a place to get tested.
   - **What about a standing order?** As testing becomes more widely available, call centers should talk with their medical leadership about triagers being able to use a standing order for testing.

   - People who have **symptoms of COVID-19.**
   - People who have had **close contact,** within 6 feet (2 meters) for a total of 15 minutes or more in a 24-hour period, with someone confirmed to have COVID-19. People who **live with someone** confirmed to have COVID-19.
   - People living or working in a congregate setting (such as a correctional facility, long-term care facility, or shelter) where an **outbreak has occurred.**

3. **COVID-19 - Where to Go for Testing?**
   - Go to the testing site recommended by your healthcare provider (e.g., doctor, NP, or PA) or public health department.
   - Swabs of the nose or throat will only be collected on patients who have a healthcare provider’s order.
   - Testing sites vary based on the city, hospital, and healthcare system.
In general, they are not performed in private doctor's offices or clinics. People cannot just walk in and request a COVID-19 test.

4. COVID-19 - What Types of Tests Are Available?
   - There are two types of tests available for COVID-19: viral tests and antibody tests.
   - **Test for Current Infection - Viral Test:** A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva sample. Symptomatic patients should get a test within 3 days, if available. Asymptomatic people with a close contact COVID-19 exposure should get the viral test on day 5 to 7 after exposure.
   - **Test for Past Infection - Antibody Test:** An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample. An antibody test may not be able to show if you have a current infection, because it can take 1 to 3 weeks for your body to make antibodies to the infection. We do not know yet if having antibodies to the virus can protect someone from getting infected with the virus again, or how long that protection might last. If an antibody test is needed, it is usually performed 2 to 3 weeks after the start of the infection.
   - The results usually come back in 1 to 3 days, but may take longer depending on testing kit or testing site availability.

5. Understanding Viral Test Results:
   - Viral tests look for part of the virus (RNA or proteins) in the test sample. Since this test looks for actual parts of the virus, it can tell you if you are currently infected (active infection) and at risk of spreading the disease. A viral test is done using a nasal (nose) swab or saliva (spit).
   - A positive viral test means that you most likely have an active COVID-19 infection and can spread the infection to others.
   - A negative viral test means that you likely did NOT have an active COVID-19 infection at the time the test was done.
   - Note: All tests can sometimes have a false (wrong) result. Some reasons for this include how the sample was collected, how long into the illness it was taken, and the type of test done. That is why it is important to discuss your results with your health care provider.

6. Understanding Antibody Test Results:
   - Antibody tests (also called serology tests) are done on blood samples.
   - COVID-19 antibody tests look for antibodies to the virus that causes COVID-19. Antibodies begin to form during an infection but can last as long as a lifetime. Therefore, an antibody test cannot tell the difference between an active infection and one you had sometime in the past.
   - It is not yet known if antibodies protect you from getting COVID-19 again.
   - A positive antibody test means that you most likely have been, or are now, infected with COVID-19.
   - A negative antibody test means that you likely never had COVID 19 OR you have not yet formed antibodies to COVID-19.

7. Understanding Viral and Antibody Testing Together:
   - In some cases, your healthcare provider (HCP) may want to perform both antibody testing and viral testing together. The best source of information on understanding the test results will come from your HCP. Here is some information on how the two results can be used together.
   - **Both Tests Are Positive:** You most likely have an active infection and can spread COVID-19 to others.
   - **Both Tests Are Negative:** You likely do NOT have COVID-19 and likely never had a COVID-19 infection.
   - **Viral Test Is Positive and Antibody Test Is Negative:** You most likely have an active infection and can spread COVID-19 to others. You have not yet developed antibodies to your active COVID-19 infection.
   - **Viral Test Is Negative and Antibody Test Is Positive:** You likely do NOT have an active COVID-19 infection but did have COVID-19 sometime in the past.
Key Points

- An outbreak of this infection began in Wuhan, Hubei Province, China in December 2019.
- The first patient in the United States occurred on January 21, 2020. During March 2020 cases were identified in all states.
- Four patients were confirmed in Canada on January 31, 2020.
- The Centers for Disease Control and Prevention (CDC) is considered the source of truth for this guideline. This continues to be a rapidly changing situation and guidance from the CDC is being updated daily. See https://www.cdc.gov/coronavirus/2019-nCoV/index.html.

Symptoms

The COVID-19 coronavirus most often causes a lower respiratory tract illness. More common symptoms are:

- Anorexia (40-84%)
- Chills (16-28%)
- **Cough** (59-82%)
- Fatigue (44-70%)
- **Fever** (83-99%)
- Loss of smell or taste (40-50%)
- Muscle pain (11-35%)
- **Shortness of breath or difficulty breathing** (31-40%)

Other symptoms may include:

- Diarrhea (2-5%)
- Headache (5-14%)
- Nausea or Vomiting (1-10%)
- Runny or Stuffy Nose (4%)
- Sore Throat (5%)
- Sputum production (14-34%)

Having two or more of any of these symptoms increases the likelihood that a person may have COVID-19.

Over 30% of infected adult patients have no symptoms (asymptomatic). Children and teens are even more likely to have no symptoms.
Cause
It is caused by a novel (new) coronavirus (COVID-19).

How it is Spread (Transmission)
COVID-19 is spread from person to person.

- **Respiratory Droplets**: The virus spreads from respiratory droplets that are produced when a person coughs, sneezes, shouts, or sings. The infected droplets can then be inhaled by a nearby person or land on the surface of their face or eyes. Droplets fall quickly to the floor or ground. This is how most COVID is spread.
- **Surfaces**: Most infected people also have respiratory secretions on their hands. These secretions get transferred to healthy people on doorknobs, faucet handles, etc. The virus then gets transferred to healthy people when they touch their face or rub their eyes. This is a less common cause of spread.
- **Aerosols**: Aerosols are tiny, invisible particles that can float in the air for 1 to 2 hours and travel more than 6 feet (2 meters). They can occur in a closed room with poor ventilation. Aerosols are a rare cause of COVID-19 spread.

Exposure Risk Factors
Risk factors for getting sick with COVID-19 are:

- **Close contact with a person** who tested positive for COVID-19 AND contact occurred while they were ill. Close contact is defined as being within 6 feet (2 meters) of an infected person for a total of 15 minutes or more in a 24-hour period. This includes living with someone infected with COVID-19.
- **Living in or travel from a city** or area where there is community spread of COVID-19. This carries a lower risk compared to close contact if one follows physical distancing recommendations. Community spread is now occurring in most of the US, especially in cities.
- **International Travel**: The CDC (https://www.cdc.gov/coronavirus/2019-ncov/travelers) has the most up-to-date list of where COVID-19 outbreaks are occurring.

Reducing Exposure Risk - Going Out in Public
The risk of COVID-19 spread increases with how closely a person interacts with others, how many people there are, and the longer the interaction.

A person should take the following precautions whenever they go out:

- A cloth face-covering
- Hand sanitizer with at least 60% alcohol

Reducing Exposure Risk - Travel

- Avoid all non-essential travel.
- If you must travel, go to the CDC website for updates on travel advisories: https://www.cdc.gov/coronavirus/2019-ncov/travelers.

Incubation Period
The incubation period averages 5 days (range 2 to 14 days) after coming in contact with the
secretions of a person who has COVID-19.

Testing

There are two types of tests for COVID-19: viral tests and antibody tests.

⦁ **Test for Current Infection - Viral Test:** A viral test tells you if you have the COVID-19 infection right now. A viral test is done with either a nasal swab or a saliva sample.

⦁ **Test for Past Infection - Antibody Test:** An antibody test tells you if you have had COVID-19 before. This test is done with a blood sample. An antibody test may not be able to show if you have a current infection, because it can take 1 to 3 weeks for your body to make antibodies to the infection. We do not know yet if having antibodies to the virus can protect someone from getting infected with the virus again, or how long that protection might last.

The results usually come back in 1 to 4 days, but may take longer depending on testing kit or testing site availability.

When should testing be performed?

⦁ **People Who Have Symptoms of COVID-19:** A person who is symptomatic should get a COVID-19 viral test within 3 days.

⦁ **People With Close Contact Exposure:** A person who had a close contact COVID-19 exposure and is asymptomatic should get a COVID-19 viral test about 5 to 7 days after exposure.

For questions about testing, it is often best to direct the patient to their HCP (doctor, NP, PA) during office hours. The HCP is the best resource for up-to-date information on testing. National and state testing recommendations continue to change. Testing requires a HCP's order (as with all medical tests).

Diagnosis and Reporting

Clinicians should report positive test results to infection control at their health system and to their local or state health department.

Complications

Complications include pneumonia, hypoxia, ARDS, respiratory failure, and death.

The following two groups of individuals are considered as **HIGH RISK** in this guideline.

1. People with the following medical problems or conditions are at **highest** risk of complications.

   - **Age:** The risk for severe illness from COVID-19 increases with age, with older adults at highest risk.
   - **Cancer**
   - **Chronic kidney disease**
   - **Heart disease, such as heart failure, coronary artery disease**
   - **Obesity with a body mass index (BMI) of 30 or higher**
   - **Sickle cell disease**
   - **Smoking**
   - **Solid organ transplant**
   - **Type 2 diabetes**

2. According to the CDC, people with the following medical conditions might be at **higher** risk of severe illness from COVID-19 (or from influenza).
• Asthma (moderate-to-severe)
• Cerebrovascular disease (affects blood vessels and blood supply to the brain)
• Cystic fibrosis
• Hypertension or high blood pressure
• Immunocompromised state (weak immune system) from blood or bone marrow transplant, immune deficiencies, HIV, use of corticosteroids, or use of other immune weakening medicines
• Liver disease
• Neurologic conditions, such as dementia
• Pregnancy
• Pulmonary fibrosis (having damaged or scarred lung tissues)
• Thalassemia (a type of blood disorder)
• Type 1 diabetes

The adult death rate for COVID-19 is approximately 1% to 3%. The death rate is lower in children and younger adults. It is higher in older adults.

Treatment

Treatment is supportive. Oxygen and IV fluids are used for hospitalized patients. Steroid medications are used in some hospitalized patients.

On May 1, 2020 the U.S. Food and Drug Administration (FDA) granted temporary emergency use authorization (EUA) for the investigational antiviral remdesivir to treat COVID-19. Doctors can use this drug to treat patients who are hospitalized with COVID-19 who are severely ill. More research is needed to determine how well this drug works and for which patients.

On November 11, 2020 the FDA issued an EUA for the investigational monoclonal antibody therapy bamlanivimab for the treatment of mild-to-moderate COVID-19 in adult and pediatric patients.

Prevention

Social distancing and wearing masks have been proven to help prevent COVID-19.

Vaccination

Several COVID-19 vaccines have been approved or are nearing approval for use in Canada and the United States:

• AstraZeneca (Oxford)
• Janssen
• Johnson & Johnson (single shot)
• Novavax.

There are many COVID-19 vaccines still in development.

Quarantine vs. Isolation

The term quarantine means to keep someone who might have been exposed to COVID-19 away
from others. Quarantine helps prevent the spread of COVID-19 because a person with COVID-19 can spread the virus before they get sick. Also, some people can get COVID-19 and have no symptoms.

How long should a person isolate after being exposed to COVID-19? The best and safest approach is to stay at home and quarantine for 14 days. In December 2020, the CDC outlined two new optional strategies for determining quarantine duration for asymptomatic people after COVID-19 exposure:

- **Option 1**: Quarantine for only 10 days (without COVID-19 viral testing).
- **Option 2**: Get a negative viral COVID-19 test on day 5 to 7 after exposure and quarantine for only 7 days.
- With either option, continue to watch for symptoms and wear a mask for 14 days after the exposure.

The term isolation means to keep someone who is infected with COVID-19 away from others. Isolation helps prevent the spread of COVID-19 to people.

*How long should a person quarantine after getting infected with COVID-19?* A person must meet all 3 of these requirements to end the quarantine period:

- Fever gone for at least 24 hours off fever-reducing medicines AND
- Cough and other symptoms must be improved AND
- Symptoms started more than 10 days ago.
- *If unsure if it is safe for you to leave isolation, check the CDC website or call your healthcare provider.*

### Ibuprofen and Other NSAID Use for COVID-19

Some callers have expressed concerns that ibuprofen (or other NSAID) use to treat COVID-19 symptoms may worsen the disease. These concerns originated from a few physicians' comments and have since spread over social media.

To date, there is no scientific evidence (clinical trials or studies) that show that using ibuprofen negatively impacts outcome in COVID-19 patients. We will continue to review any new literature as it is published. The CDC, WHO, AAP and our Infectious Disease expert reviewers continue to approve the use of ibuprofen for COVID-19.

For these reasons, Schmitt-Thompson Clinical Content (STCC) guidelines continue to recommend ibuprofen as an acceptable way to treat high fevers and pain.

- Remind callers that fevers may be beneficial, help fight the infection, and speed recovery.
- Low-grade fevers should not be treated.

If callers remain concerned, they can use acetaminophen for symptoms that warrant treatment.

*Caution:* For suspected COVID-19 patients on oral steroids, such as prednisone, the triager should involve the HCP for a decision about whether the drug can be continued.

### Other Coronaviruses in Humans

*Common coronaviruses* can cause colds and upper respiratory symptoms. These can be identified in currently available commercial respiratory testing panels (human coronaviruses HKU1, OC43, 229E, and OC43). These coronaviruses are completely different than the novel coronavirus addressed in this guideline.

Two other coronaviruses that previously have caused serious outbreaks are:
• **MERS-CoV**: Middle East Respiratory Syndrome (MERS)
• **SARS-CoV**: Severe Acute Respiratory Syndrome (SARS)

**Animals and COVID-19**

• The main way COVID-19 spreads is from person to person. There is low risk of getting COVID-19 from a pet or other animal.
• It is possible for animals to catch COVID-19 from people. A few pets have tested positive for COVID-19 (including cats and dogs).
• The CDC recommends treating pets like other family members when trying to avoid spreading COVID-19. Do not let pets have close contact with other people or animals outside your household. A sick person should self-isolate and avoid contact with both people and pets.
• Call your vet if your pet gets sick or you have other questions.
• The CDC has more information on COVID-19 and animals at: [https://www.cdc.gov/coronavirus/2019-ncov/daily-life-coping/animals.html](https://www.cdc.gov/coronavirus/2019-ncov/daily-life-coping/animals.html).
